DETAILED ACTION

Election/Restrictions

1. Newly submitted claims 8-10 directed to an invention that is independent or distinct from the invention originally claimed for the following reasons: the newly submitted claims disclose a gas turbine wherein at least one of two predetermined vane angle positioning schedules modulate an airflow volume consumed by the compressor component as a function of the compressor rotational speed so as to maintain a constant turbine output power. Moreover, the claim specifies that a transitioning is done between a first predetermined vane positioning schedule and a second predetermined vane positioning schedule in response to an occurrence of a change in operational load conditions of the power grid and that the transitioning between the first and second positioning schedule occurs whenever the power grid operating load conditions changes between a normal condition and under-frequency condition and vice-versa.

Since applicant has received an action on the merits for the originally presented invention, this invention has been constructively elected by original presentation for prosecution on the merits. Accordingly, claims 8-10 are withdrawn from consideration as being directed to a non-elected invention. See 37 CFR 1.142(b) and MPEP § 821.03.

Allowable Subject Matter

2. Claims 4-7 are allowed pending the cancellation of the withdrawn claims.

The prior art does not teach controlling an angular position of the stator vanes in accordance with a predetermined nominal vane positioning schedule during ordinary base load power grid operational conditions and during an onset of a power grid under-frequency condition, providing a gradual change in angular position of the stator vanes with respect to compressor physical speed from operating according to the predetermined nominal vane positioning schedule to operating according to a predetermined under-frequency vane positioning schedule and varying the angular position of the stator vanes in accordance with the predetermined under-frequency vane positioning schedule during the power grid under-frequency condition and the gradual change in angular position of the stator vanes during a transition in operation from the nominal vane positioning schedule to the predetermined under-frequency vane positioning schedule is linear with respect to a change in turbine compressor speed.

Conclusion

3. This application is in condition for allowance except for the following formal matters noted above.

Prosecution on the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

A shortened statutory period for reply to this action is set to expire **TWO MONTHS** from the mailing date of this letter.
